Why Do Hot Air Balloons Float?

BOYLE'S LAW

Boyle's Law states that the volume of a gas varies inversely with its pressure if temperature is held constant.

(If one goes up, the other goes down.) We use the formula:

 $P_1 \times V_1 = P_2 \times V_2$

Solve the following problems (assuming constant temperature). Assume all number are 3 significant figures.

- 1. A sample of oxygen gas occupies a volume of 250 mL at 740 torr pressure. What volume will it occupy at 800 torr pressure?
- 2. A sample of carbon dioxide occupies a volume of 3.50 Liters at 125 kPa pressure. What pressure would the gas exert if the volume was decreased to 2.00 liters?
- 3. A 2.00-Liter container of nitrogen had a pressure of 3.20 atm. What volume would be necessary to decrease the pressure to 1.00 atm?
- 4. Ammonia gas occupies a volume of 450 mL as a pressure of 720 mmHg. What volume will it occupy at standard pressure (760 mmHg)?
- 5. A 175 mL sample of neon had its pressure changed from 75.0 kPa to 150 kPa. What is its new volume?
- 6. A sample of hydrogen at 1.50 atm had its pressure decreased to 0.50 atm producing a new volume of 750 mL. What was the sample's original volume?
- 7. Chlorine gas occupies a volume of 1.20 liters at 720 torr pressure. What volume will it occupy at 1 atm pressure?
 - 8. Fluorine gas exerts a pressure of 900 torr. When the pressure is changed to 1.50 atm, its volume is 250 mL. What was the original volume?

Why Do Hot Air Balloons Float?

CHARLES'S LAW

Charles' Law states the volume of a gas varies directly with the Kelvin temperature, assuming the pressure is constant. We use the following formulas:

$$\frac{V_1}{T_1} = \frac{V_2}{T_2} \quad \text{or} \quad V_1 \times T_2 = V_2 \times T_1$$

$$K = {}^{\circ}C + 273$$

Solve the following problems assuming a constant pressure. Assume all numbers are 3 significant figures.

- 1. A sample of nitrogen occupies a volume of 250 mL at 25 °C. What volume will it occupy at 95 °C?
- 2. Oxygen gas is at a temperature of 40 °C when it occupies a volume of 2.30 Liters. To what temperature should it be raised to occupy a volume of 6.50 Liters?
- 3. Hydrogen gas was cooled from 150 °C to 50 °C. Its new volume is 75.0 mL. What was its original volume?
- 4. Chlorine gas occupies a volume of 25.0 mL at 300 K. What volume will it occupy at 600 K?
- 5. A sample of neon gas at 50 °C and a volume of 2.50 Liters is cooled to 25 °C. What is the new volume?
- 6. Fluorine gas at 300 K occupies a volume of 500 mL. To what temperature should it be lowered to bring the volume to 300 mL?
- 7. Helium occupies a volume of 3.80 Liters at -45 °C. What volume will it occupy at 45 °C?
- 8. A sample of argon gas is cooled and its volume went from 380 mL to 250 mL. If its final temperature was -55 °C, what was its original temperature?
